NCSL MILEAGE DATA COLLECTION OPTIONS FOR ROAD USAGE CHARGING

Matthew Dorfman CDM Smith

August 13, 2023

Agenda

- RUC Study Status impacting mileage data collection
- RUC Lessons Learned impacting mileage data collection
- RUC Collection Options
- Concluding Remarks

1 RUC Study Status

Status of RUC research in 2023

Impacting mileage data collection

Lessons learned about RUC: Policy

Privacy

- <u>Must</u> be explicitly addressed in every pilot/program. Provisions:
- Offer non-location based milage reporting
- State never gets location data
- Have privacy policy and legal protections

Rate setting

- Avoid perception of "double taxation" / "raising taxes"
- Charging in lieu of flat fee is easier than charging in lieu of gas tax
- Vehicle owners should understand rate / how it is set
- Single rate, revenue neutral with gas tax is most common choice

Lessons learned about RUC: User Interaction

Communications / PR

- Begin with clear communications about reasons for RUC
- Fairness and "user pays" are popular messages
- Explain how RUC is collected, so it's not scary/burdensome
- Pilots serve as communications tools

User experience

- Simple, clean user interface, with as few touch points as possible
- Have good customer service

Lessons Learned about RUC: Government

- Government role in RUC varies by state
 - DMV provides database, DOT or DMV may lead
 - Exact government role depends on collection method(s)
- States can operate non-location-based methods
- Commercial Account Managers: best option for high tech
 - Private firm collects on behalf of state
 - State oversight required
- Open Market concept
 - CAMs can enter the market in a given state at any time
 - Generally appropriate for larger programs

RUC Collection Options

3

Spectrum of reporting options

Non-location-based options

Pros	Cheaper, private	Pros	Captures out of state,
Cons	Does not capture out of		offroad miles
	state, offroad miles	Cons	More expensive, privacy
			concerns

Location-based options

Odometer Reporting (in person)

 Annual/biannual safety inspections required in 12 states, emissions inspections required in regions of 21 states

Hawaii's system will leverage existing inspections

ProsConsVery high privacyChallenging to implement in states
without inspectionsLow cost in states with
inspectionsEven in states w/inspections, requires
substantial development

Odometer reporting: self

- Type in odometer once or more/year
- Audit some percentage of entries (odometer image and/or CARFAX)
- Cost: Low (~<\$5/vehicle/year)</p>

Washington Road Usage Charge Simulation

To fund our state's roads and bridges, Washington relies on the gas tax, a tax we pay every time we buy gas. As cars become more fuel efficient and electric cars become more common, we buy less gas. This means that over time, our state has less gas tax available to maintain roads and bridges. To address this challenge, we're exploring a possible replacement for the gas tax called a road usage charge.

With a road usage charge, drivers would pay for how much they drive instead of paying by the gallon like we currently do. Drivers would either pay a gas tax or a road usage charge, but not both.

This simulation imagines how a road usage charge program could

Pros	Cons
Very high privacy	Auditing will require effort to perfect
Low cost	

Odometer image capture

13

- Using camera phone / smartphone
- Employs various fraud protection measures

- "Low confidence" images require manual review
- Cost: \$2-3 per photo with account management

Pros	Cons
Easy to use	Requires a lot of reminders, penalties for those who don't submit
High privacy	Requires manual image review
	Need solution for those w/o phones
	Need to link image to vehicle

In-vehicle device

- Most commonly used option today
- GPS+cellular modem
- Cost: ~\$50-100/vehicle/year

Pros	Cons
Most commonly used option	High cost
Proven	Distribution/collection/inventory
	Need install device
	Limited lifespan
	What if plug is occupied?
	Little OEM support, incl errors

Smartphone App

- Uses detailed location information
- Phone linked to vehicle (e.g., Bluetooth)
- Requires periodic/annual true up
- Low cost at scale (~\$12/vehicle/year)

Pros	Cons
Can be user friendly	Requires users have smartphones
Low cost	No location when phone not in vehicle

Automaker data (third party API)

Uses third party to access vehicle telematics data. 2 varieties:

- 1. Vehicle "pinging" (no agreement with automakers)
- 2. Backend Data (explicit agreement with automakers)
- Cost: \$75-100+/year incl API, CAM, automaker

Pros	Cons	
Available today	Location precision varies by provider & automaker	
Backend data approach has good data	For vehicle pinging variety, users may need to subscribe, share username/PW	
	May cost \$50-100+/year (could drop)	
	Only for sufficiently equipped vehicles	

Vehicle data (direct from automaker)

Automakers have been reluctant to support

- SAE J3217/R in final stages of development
- Cost: \$100+/vehicle/year, incl CAM, automaker

Pros	Cons
Potential for highest resolution data	Automakers have been very reluctant to support
Potential for best user experience	Could be quite expensive
	Unique implementation per automaker
	Only for sufficiently equipped vehicles
17	Se S

Payments

- RUC payments have mostly been structured as prepayment
 - Generally in form of electronic wallet
 - Prevents fraud, keeps current cash-flow in place
- Payment methods
 - Card payment is most common, sufficient for limited programs
 - In larger programs, need cash payment (payment network) and apps (Venmo) needed to cover unbanked and underbanked

Frequency

- Once a year is cheapest to operate, but requiring users to pay \$100+ at once has major equity implications
- Likely keep wallet refreshes to lower amount and/or offer installment payments

Technology Forecast

- Odometer-based methods will be offered as an option in RUC programs for the next 20 (or more) years
- Smartphone apps will become and remain the most common location-based method for some time, due to capabilities and cost
- In the long-term, telematics will play an increasing role:
 - APIs without automaker agreements/vehicle pinging have limited usage
 - APIs with automaker agreements/backend data need to be trialed, but must be cost-competitive with smartphone apps
 - Automakers may need encouragement to support RUC

Questions are Welcomed
